The MessageLabs Difference

- Cost-effective service facilitating quick and efficient business communications
- Creates a secure and private network connecting employees, partners, and customers, via TLS encrypted communications
- Enables IM users to communicate and exchange files with each other in real time with complete security and privacy
- Integrates with consumer IM and collaborative tools, such as WebEx and Salesforce.com
- Intuitive and easy to use for end-users and customizable for IT administrators via a user-friendly, web-based administration and reporting tool
- Winner of SC Magazine's Best Buy honors and a 5-star rating

Analyst View

"Instant messaging (IM) threats from viruses, worms and other malicious code are increasing at an alarming rate. Few organizations have taken steps to secure their IM systems, which is often a low priority for security and messaging teams."

Matt Cain, Gartner 2005

Is your use of Instant Messaging secure?

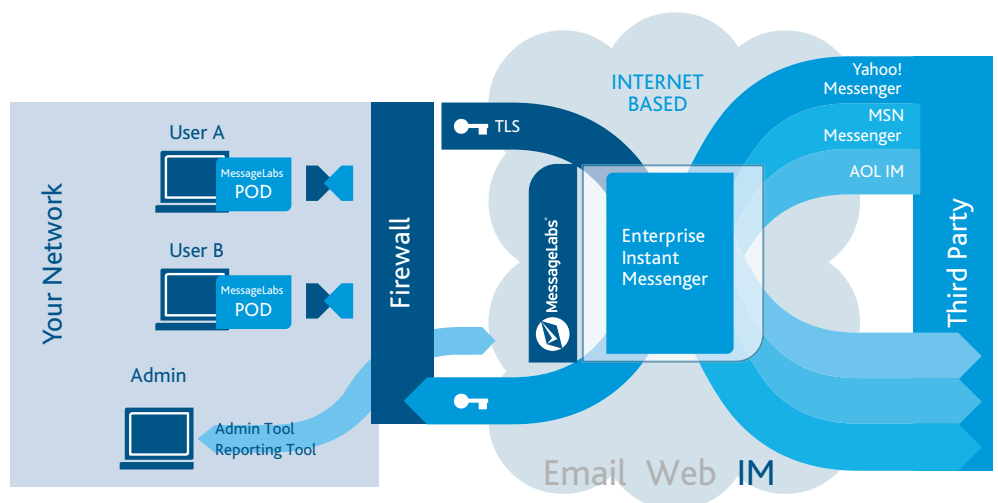

Instant Messaging (IM) is rapidly establishing itself as a key means of business communications. In fact, by year end 2008, 80% of enterprise workers worldwide are expected to be using IM (Radicati Group, 2004). Easier to use than email, its speed and immediacy facilitates real-time communication, collaboration, and information-sharing. These benefits translate directly into efficiency and productivity.

But its immediacy and informality also makes IM a potentially serious source of risk. Profit-eroding, brand-damaging viruses, worms, and trojans, as well as SPIM (spam over IM), can easily penetrate your organization via consumer IM networks, such as AOL, MSN, and Yahoo! Furthermore, left unmanaged, IM can lead to unwanted exposure of confidential data and violation of regulations in areas such as the maintenance of IM logs. Despite the security risks, few organizations have taken measures to safeguard themselves adequately.

The MessageLabs Enterprise Instant Messenger (EIM) Service enables you to enjoy all of IM's benefits without any of the risks. Providing you with a secure, private IM network that allows in-house employees, remote workers, and business partners to communicate and collaborate effectively and safely, it also incorporates sophisticated administration, monitoring, and comprehensive message-logging capabilities.

The service is easy to set up and use, is fully interoperable with consumer IM networks and can be accessed from any internet-enabled PC. Securely encrypting communications between users, it offers you an unrivalled level of confidence and certainty in your IM communications.

Secure, productive instant messaging – our solution

How the service works

- An enterprise-class, secure EIM client (a Professional Online Desktop – POD) is installed on a user's desktop
- Authorized users have access to a secure, private IM network that uses TLS encrypted tunnels
- All messages and file attachments exchanged over the network are fully encrypted and cannot be intercepted or tampered with
- All file attachments exchanged over the network are scanned for viruses, worms, trojans and other malware
- Administrators can monitor use of the service through an extensive reporting tool available in an easy-to-use, web-based portal

Corporate governance

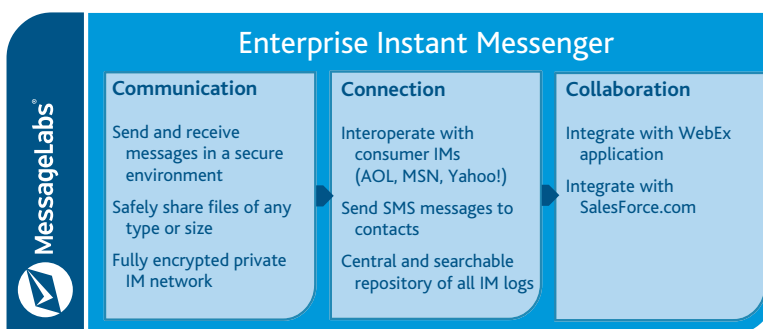

- The MessageLabs EIM Service ensures businesses can avoid the dangers arising when employees install and use consumer IM applications, often without the involvement of corporate IT staff
- By allowing IM use to be managed and monitored at a corporate level, the service enables businesses to develop, enforce, and benefit from best practice policies on IM use
- With access limited to authorized users, ex-employees can no longer access the network and the resulting risks are eliminated

The MessageLabs EIM Service provides your organization with a proven, completely reliable means of managing and optimizing your IM use. The service is available in three bundles:

EIM Communicate - Includes MessageLabs POD (a Professional Online Desktop), enabling users to securely send and receive messages, save and search IM sessions, and simultaneously exchange messages and files; and EIM File Sharing, enabling users to transfer files of any type or size, whether the recipient is online or not.

EIM Connect - Includes all the benefits of EIM Communicate, plus EIM Interoperate, enabling users to connect safely with major consumer IM networks and create a buffer against viruses, worms, Trojans, and other threats; EIM Logging, which stores logs of all IM conversations in a central location; and EIM SMS, enabling users to send SMS (Short Message Service) messages directly from their POD interface.

EIM Collaborate - Includes all the benefits of EIM Connect, plus provides integration with additional applications such as WebEx and Salesforce.com. Enables users to work with a full suite of communication products within a single interface.

Features and Benefits of the EIM Service

Feature	Benefit
Accessible from any PC connected to the internet, anywhere in the world	Facilitates real-time business communication, aiding effective decision-making and action-taking
Uses TLS to encrypt all IM communications between authorized network users	Ensures security of confidential information, promoting trust with your partners and clients
Protects against virus, SPIM and other IM-borne threats and prevents their spread by blocking access to buddy lists	Minimizes disruption caused by IM-borne threats and cuts costs involved in identifying and tackling them
Robust, flexible system that is simple to install, easy to use and virtually maintenance-free	Eliminates unnecessary investment in infrastructure and reduces burden on in-house IT support services
Centralized storage/logging facility, plus detailed reporting interface with fast access to IM conversation logs, activity reports and usage reports	Ensures regulatory compliance, for example by guaranteeing readily available IM logs required as part of legal discovery
All file-sharing transactions take place within the centralized server	Reduces in-house bandwidth requirements
Comprehensive administration tool enables management of domain structures and user base through web-based console	Delivers corporate management of IM by providing control of contacts and feature permissions
